Key Diagnostics has a wide range of microbiology and rapid hygiene products for the food & beverage industry.

Diluents & Broths

Food Adulteration

Microbial ID

Latex Agglutination Kits

Laboratory Automation

Pathogen Testing

Microbial Counting

Hygiene testing is the process to determine whether a surface not only has been cleaned properly but it is also safe to use. Traditionally this has been achieved through microbiological testing which takes days to get an answer. Faster alternatives are now available which look for a specific biological indicator to gauge clean efficacy. These include ATP, protein and glucose/lactose residues and have the advantage of results in seconds to minutes, allowing corrective action to be taken immediately.
